

PE Wood Plastic Sheet Production Line From <http://>

Screw adopts special mixing function and high plasticizing capacity design.

Coat-hanger die use a special double flow design which allows more precise adjustment to sheet thickness.

Temperature control of plus or minus 1 ° can accurately control the plasticizing process and sheet thickness.

Three Roll-ray machine adopts vertical lifting method.

Sheet thickness control with a two-way roller screw adjustment and precise control of sheet thickness can be adapted .

The roller temperature control system can precisely control the temperature ensures sheet thickness uniformity.

Cutting machine: synchronize cutting, and plate length has the numerical precision.

Winding device used in high torque motor, is able to adjust the speed and tension retractor.

Equipped with automatic meter device, it can be set to the length of the products
